1 Product Description

The GZP6830D pressure sensor utilizes a ceramic substrate, housing a packaged pressure sensor and signal conditioning chip. This package digitally compensates for sensor offset, sensitivity, temperature drift, and nonlinearity. An internal signal processor converts the outputs of the pressure and temperature sensor elements into 24-bit and 16-bit data, respectively. Each pressure sensor is individually calibrated and includes calibration coefficients. These coefficients are used in applications to convert measurement results into true pressure and temperature values. Sensor measurements and calibration coefficients are accessible via a serial I2C interface.

The GZP6830D pressure sensor's internal chip and gold wires are coated with fluorinated silicone, providing resistance to water, moisture, oil, and gas.

The GZP6830D pressure sensor offers fast response, high accuracy, low power consumption, and excellent linearity and stability. Its compact size and ease of installation facilitate system integration, making it widely used in consumer electronics, automotive electronics, fire protection, home appliances, and other civilian applications.

1.1 Features

- Multiple range from 0 to 700...3000kPa
- Absolute pressure type
- Power supply voltage: 1.8V ~ 3.6V
- Current consumption: <80uA (maximum oversampling rate for one measurement)
- Standby current: 0.1uA (at 25°C)
- Ceramic packaging structure, moisture-proof and oil-proof
- IIC Interface
- Temperature compensated
- High accuracy

1.2 Applications

- Automobile and motorcycle air intake systems, tire pressure gauges, vehicle air pumps and other automotive electronics fields
- Air pumps, vacuum pumps, pressure switches, pneumatic control systems and industrial equipment, etc. Air-actuated control system
- Fire extinguishers, weather stations, navigation and other fields
- Other absolute pressure measurement systems

2 Function Description

This product is manufactured using advanced micro-electromechanical principles. Its core technologies are a MEMS pressure sensor chip based on the silicon piezoresistive effect and a high-performance signal conditioning ASIC chip. The silicon micro-piezoresistive MEMS pressure sensor chip forms a Wheatstone bridge through four strain-sensitive resistors. The output signal is amplified, temperature-compensated, and linearized by the ASIC chip. The linearization and temperature compensation of the transfer function are implemented by the digital processing circuit in the ASIC. Through the polynomial compensation algorithm and multi-point pressure calibration technology at multiple temperatures, high-precision pressure measurement is achieved over the entire operating temperature range.

2.1 Block Diagram

The functional block diagram of the pressure sensor is shown in Figure 1.

Fig.1 Block Diagram

2.2 Pin Definition

The pin configuration of the pressure sensor is shown in Figure 2.

Fig.2 Pin configuration diagram

The corresponding relationship of the pressure sensor pins is shown in Table 1.

Tab.1 Pin Definition

PIN No.	Description	Remark
1	GND	Power input negative
2	SCL	I2C clock line
3	SDA	I2C bidirectional data line
6	VDD	Power input positive
4/5/7/8	NC	Floating pin

2.3 Accuracy

GZP6830D pressure sensor is affected by supply voltage, input pressure, ambient temperature, and aging. The value calculated using the transfer function is the sensor's specified value, also known as the theoretical value. The sensor's error is the difference between the actual output value and the specified output value at a specified input pressure.

Overall Accuracy

The overall error includes more accuracy sources based on the product accuracy :

Pressure drift: The output deviation between the actual output voltage at zero point and full scale and the specified output voltage within the specified pressure range.

Temperature effect: The output deviation of zero point and full scale at different temperatures within the temperature range.

The overall accuracy is expressed by error band, and the data are shown in Figure 3 and Table 2 shown.

Fig.3 Overall Accuracy vs. Temperature.

Tab.2 Overall Accuracy

Temperature (°C)	Overall Accuracy(Span%)
-30~105	±3.0%
0~60	±1.5%

* Different pressure ranges have different Overall Accuracy. Please consult Sencoch for more details.

3 Technical Indicators

The following indicators of the sensor are measured with (3.3)V DC and 25°C.

3.1 Maximum Ratings

The maximum rated parameters of the sensor are shown in Table 2.

Tab.2 The maximum rated parameters

Parameter	Min.	Typical Value	Max.	Unit	Remark
Supply Voltage	-0.3		3.6	V	
ESD Protection		2		kV	HBM
Storage Temp.		-40		125	°C
Working Temp.		-30		105	°C

3.2 Performance Indicators

The sensor performance indicators are shown in Table 3

Tab.3 Performance indicator

Parameter	Conditions	Min.	Typ.	Max.	Units
Temp.Measure Range	Interior temp.sensor	-40		150	°C
Pressure Accuracy			±1		%Span
Temp. Measure Accuracy		-2		2	°C
Over Pressure			1.5x		Rated
Burst Pressure			2.0x		Rated

Compensated Temp.

-10

60

°C

3.3 Electrical Characteristics

The sensor electrical characteristics are shown in Table 4

Tab.4 Electrical Characteristics

Parameter	Conditions		Min	Typ	Max	Units
	At VDD=2V		32			dB
Average current during 1Hz conversion rate measurement	OSR_P	Oversampling rate 128x		80		μA
		Oversampling rate 64x		42		
		Oversampling rate 32x		23		
		Oversampling rate 16x		13		
		Oversampling rate 8x		8		
		Oversampling rate 3x		6		
		Oversampling rate 2x		4		
Peak Current				0.3		mA
Standby Current	Standby current in sleep state at 25°C			50	250	nA
Single measurement time (Including external bridge and temperature measurement time, the OSR of temperature measurement is 1024x)	OSR_P	Oversampling rate 128x		203		ms
		Oversampling rate 64x		105		
		Oversampling rate 32x		56		
		Oversampling rate 16x		31		
		Oversampling rate 8x		19		
		Oversampling rate 4x		13		
		Oversampling rate 2x		10		
ADC Conversion rate	OSR as 2x ~ 128x		20		1350	Hz
I2C Clock frequency					3.4	MHz
Temperature resolution				0.003		K/LSB
Start Time	VDD to the time when the interface communication starts				1	ms
	VDD to the time when the measurement starts				2.5	ms
Wake up Time	Sleep status to the time when the interface communication starts				0.5	ms
	Sleep status to the time when the measurement starts				2	2

4 Application Circuit

The recommended application circuit of the sensor is shown in Figure 4.

Fig.4 Recommended sensor application circuit diagram

Notice :

- The recommended value of C1 is 100nF, and the recommended values of R1 and R2 are 4.7k.
- Please confirm the electrical definition before assembly.
- Do not have any electrical connection to the NC pin, otherwise it may cause product failure.
- Provide anti-static protection during welding.
- Overload voltage (6.5Vdc) may burn out the circuit chip.
- This product has no reverse polarity protection, please pay attention to the power polarity during assembly.

5 I²C Communication Protocol

The I2C bus uses SCL and SDA as signal lines, both of which are connected to VDD through pull-up resistors (typically 4.7K) and remain high level when not communicating.

The sensor is calibrated at the factory. Sending the 0xAC command to get the calibrated data..

Write Command

0xF0 means that the default 7bits I2C sensor slave device address is 0x78, and the last 1bit is 0 means that the master device MCU writes to the slave device. 0xAC is the command word to start the slave device sensor to perform a measurement. (The write address is $0x78 \ll 1 + 0 = 0xF0$, and the read address is $0x78 \ll 1 + 1 = 0xF1$)

Read Command

S	0XF1	A	Status	N	P
---	------	---	--------	---	---

After sending the write command, need to wait for a while till measurement finish from the slave device sensor, and then send the read command to read the measurement data. Then sending the 0XF1 command to determine whether the sensor data acquisition has been completed

The waiting time depends on the settings of [13:11] Pressure Oversampling Rate of OTP (Address: 0x14) and [15:14] Temperature Oversampling Rate of OTP (Address: 0x14). The waiting time is =Tp+Tt.

Pressure Oversampling Rate and Measurement Time Comparison Table

OSR_Pressure[13:11] (Binary)	OSR	Measurement Time Tp(ms)
000	32768	203
001	16384	105
010	8192	56
011	4096	31
100	2048	19
101	1024	13
110	512	10

Temperature Oversampling Rate and Measurement Time Comparison Table

OSR Temperature[15:14] (Binary)	OSR	Measurement Time Tt(ms)
00	2048	19
01	4096	31
10	8192	56
11	16384	105

Read Pressure Value

The read calibration data consists of 6 bytes, which are 1-byte status word, 3-byte pressure calibration value, and 2-byte temperature calibration value.

S	0XF1	A	Status	A	BridgeDat [23:16]	A	BridgeDat [15:8]	A	BridgeDat [7:0]	A	TempDat [15:8]	A	TempDat [7:0]	N	P
---	------	---	--------	---	-------------------	---	------------------	---	-----------------	---	----------------	---	---------------	---	---

Table5: Status of Bits

Bit	Significancy	Description
Bit7	Reserved	Absolute value 0
Bit6	Power indication	1: Power on; 0: Power off
Bit5	Busy indication	1: Data collection incomplete 0: Data collection complete, data for reading.
Bit4	Reserved	Absolute value 0
Bit3	Reserved	Absolute value 0
Bit2	Reserved	Absolute value 0
Bit1	Reserved	Absolute value 0
Bit0	Reserved	Absolute value 0

Table6: I2C Command

Command(byte)	Return	Description	NOR Mode	CMD Mode
0x00~0x1F	16-bit data	Read data in the OTP that address matching command	Support	Support
0x40~0x5F Followed command byte: 0x0000 ~0xFFFF	—	Write data to OTP; Address is Command value subtract 0x40 (Address is 0x00 to 0x1F)	Support	Support
0xA0~0xA7 Followed command byte: 0XXXXX	24-bit raw data Get_Raw	Get_Raw Conduct one measurement, and write the raw ADC data to registers. See table 6-3 for further interpretation	Support	Support
0xA8	24-bit raw data Get_Raw	Start_NOM Quit CMD mode, enter NOR mode	No-Support	Support
0xA9	—	Start_CM Quit NOR mode, enter CMD mode	Support	No-Support
0xAA	—	Write_ChecksumC If CRC values are not wrote to OTP, the command check data in OTP register and writes CRC values to OTP	Support	Support
0xAC	24-bit compensated bridge data and 16-bit compensated temperature data	Get_Cal Measure based on OTP settings(AZBM, BM,AZTM and TM), write compensated bridge and temperature data to I2C interface	Support	Support
0xB0~0xBF	24-bit compensated bridge data and 16-bit compensated temperature data	Get_Cal_S and Get_Cal are the same except that Get_Cal measures based on OTP defined OSR and Get_Cal_S measures based on command defined OSR, see following table	Support	Support

Table7: Get_Cal_S Command

Command 0xBX(HEX)	Function	Detail
X [3] Bit	OSR_T, ADC OSR of temperature measurement	0: 4x OSR 1: 8x OSR
X [2:0] Bit	OSR_P, ADC OSR of pressure measurement	000: 128x OSR 100: 8x OSR 001: 64x OSR 101: 4x OSR 010: 32x OSR 110: 2x OSR 011: 16x OSR 000: 1x OSR

For example, to set the temperature ADC to 4x oversampling and the piezoelectric panel ADC to 1x oversampling, the command format is 0xB7, Just replace 0xAC with 0xB7

Table8: OPT Register

Addr	Bit Range	Description	Notes/Explanations
0x00~0x13		Calibration Coefficient	
0x14	15:14	Temperature_OSR	00:8X 01:16 X 10: 32X 11:64X
	13:11	Pressure_OSR	000: 128X 001: 64X 010: 32X 011: 16X 100: 8X 101: 4X 110: 2X 111: 1X
			000 : 1/16 → [-1/16, 15/16] 001 : 2/16 → [-2/16, 14/16] 010 : 3/16 → [-3/16, 13/16] 011 : 4/16 → [-4/16, 12/16] 100 : 5/16 → [-5/16, 11/16] 101 : 6/16 → [-6/16, 10/16] 110 : 7/16 → [-7/16, 9/16] 111 : 8/16 → [-8/16, 8/16]
	10:8	ADC offset	
	7:6	Reserved	
	5	Signal Polarity	1: No Inversion, 0: Inversion
	4:0	Reserved	
0x15~0x16		Internal Test	
0x17	4	Interrupt Enable	0: disable, 1: enable
	3:2	Interrupt 0 Configuration Bits	00 : Invalid 01 : Calibration value exceeds preset upper limit (TH_H) 10 : Calibration value falls below preset lower limit (TH_L) 11 : Calibration value exceeds preset upper limit (TH_H) or falls below preset lower limit (TH_L)
	1:0	Interrupt 1 Configuration Bits	00 : Invalid 01 : Calibration value exceeds preset upper limit (TH_H) 10 : Calibration value falls below preset lower limit (TH_L) 11 : Calibration value exceeds preset upper limit (TH_H) or falls below preset lower limit (TH_L)

6 Value Conversion and Calculation

Calculation Formula:

$$\text{Pressure} = (\text{PMAX} - \text{PMIN}) / (\text{DMAX} - \text{DMIN}) (\text{Dtest} - \text{DMIN}) + \text{PMIN}$$

$$\text{Temperature} = \text{Temp_ADC} / 65536190 - 40$$

Where:

PMAX: Calibration upper limit pressure value for pressure range; PMIN: Calibration starting pressure value for pressure range

DMAX: AD value corresponding to calibration upper limit pressure; DMIN: AD value corresponding to calibration starting pressure

Dtest: Current pressure reading AD value

After reading calibration data, a simple conversion is needed for the unsigned number represented in AD value form.

Example Illustration: Assuming PMAX: 700KPA, calibration starting pressure 0KPA, corresponding AD output is DMAX: 14260633 and DMIN: 2516582

The read calibration data is: 0x00 0x9B 0xB0 0xC5 0x5F 0x30

0x00 is the status word: Bit5 = 1 indicates that the last I2C was busy, and a wait is required. If Bit5 = 0, the device is not busy, and data can be read. For detailed descriptions of each bit in the status word, please refer to Table 4. Bit Description.

0x9B 0xB0 0xC5 three bytes are the pressure calibration value, converted to decimal is 10203333;

0x5F 0x30 two bytes are the temperature calibration value, converted to decimal is 24368;

According to the above formula:

$$\text{Actual pressure value} = ((700 - 0) / (14260633 - 2516582)) * (10203333 - 2516582) + 0 = 468.53 \text{ KPA.}$$

$$\text{Actual temperature value} = (24368 / 65536 * 190 - 40) = 30.65 \text{ }^{\circ}\text{C.}$$

Note: Corresponding relation between Pressure range and AD value

Pressure Range(kPa)	Lower Range Value	Upper Range Value	Opposite AD value(Pmin)	Opposite AD value(Pmax)
	Pmin	Pmax	Dmin_P	Dmax_P
30~110	30	110	2516582	14260633
0~300	30	300	2516582	14260633
100~1500	100	1500	2516582	14260633
100~3000	100	3000	2516582	14260633

7 Structure Specification (unit:mm)

Refer to Figure 5 for the sensor's dimensions (error is $\pm 0.1\text{mm}$ if not specified).

Fig.5 Product dimensions

The recommended pad dimensions are shown in Figure 6.

Fig.6 Footprint dimensions

10 Instruction for Use

10.1 Soldering

Since this product has a small structure with low heat capacity, please minimize the influence of heat from the outside. Otherwise, it may be damaged due to thermal deformation and cause changes in characteristics. Please use non-corrosive rosin type flux. In addition, since the product is exposed to the outside, please be careful not to allow flux to penetrate into the inside.

(1) Manual soldering

- Use a soldering iron with a head temperature between 260 and 300°C (30 W) and perform the work within 5 seconds.
- Please note that the output may change when soldering with a load applied to the terminals.
- Please keep the soldering iron tip clean.

(2) Reflow soldering (SMD terminal type)

- The recommended reflow oven temperature setting conditions are shown:

Fig.7 Remelting temperature setting conditions

(3) The warping of the printed circuit board relative to the entire sensor should be kept below 0.05mm. Please manage this.

(4) After installing the sensor, be careful not to generate stress on the solder joint when cutting and bending the substrate.

(5) Since the sensor terminals are exposed, contact with metal pieces or other objects may cause abnormal output. Be careful not to touch the terminals with metal pieces or your hands.

(6) When applying coating to prevent insulation degradation of the substrate after soldering, be careful not to allow chemicals to adhere to the sensor.

10.2 Cleaning Requirements

- (1) Since the product is open type, please be careful not to allow cleaning fluid to enter the interior.
- (2) Please avoid using ultrasonic cleaning as it may cause product failure.

10.3 Storage and Transportation

- (1) This product is not drip-proof, so do not use it in places where it may be splashed with water.
- (2) Do not use in an environment where condensation occurs. In addition, if moisture attached to the sensor chip freezes, it may cause fluctuations in sensor output or damage.
- (3) Due to the structure of the pressure sensor chip, the output will fluctuate when it is exposed to light. Especially when applying pressure through a transparent cover, etc., please avoid light from reaching the sensor chip.
- (4) Normally packaged pressure sensors can be transported by ordinary transportation vehicles. Please note: The product must be protected from moisture, shock, sunburn and pressure during transportation.

10.4 Other Precautions

- (1) If the installation method is incorrect, it may cause an accident, so please be careful.
 - (2) Avoid using the product in a manner that applies high-frequency vibrations, such as ultrasonic waves.
 - (3) The only pressure medium that can be used directly is non-corrosive gas or liquid. Other media, especially corrosive media or media containing foreign matter, may cause malfunction and damage. Therefore, please avoid using it in the above environment.
 - (4) A pressure sensor chip is located inside the pressure inlet. Inserting a needle or other foreign object into the pressure inlet can damage the chip and clog the inlet, so please avoid such an operation.
 - (5) Regarding the operating pressure, please use it within the rated pressure range. Using it outside the range may cause damage.
 - (6) Since static electricity may cause damage, please be careful to ground charged objects on the table and operators when using it to allow the surrounding static electricity to discharge safely.
- If you have any questions, please feel free to ask.

11 Packaging Information

Reel&Tape information as shown in Figure 8 (unit: mm)

Quantity per tray 3000 PCS.

Safety Precautions

This product is made of semiconductor components for general electronic equipment (communication equipment, measuring equipment, working machinery, etc.). Products using these semiconductor components may malfunction and fail due to external interference and surges, so please confirm the performance and quality under actual use. To be on the safe side, please perform safety design on the device (setting of protection circuits such as fuses and circuit breakers, multiple devices, etc.) so that life, body, property, etc. will not be harmed in the event of a malfunction. To prevent injuries and accidents, please be sure to comply with the following matters:

- The driving current and voltage should be used below the rated values.

Please wire according to the electrical definition . In particular, reverse connection of the power supply may cause accidents due to circuit damage such as heat, smoke, and fire, so please be careful.

- Be careful when fixing the product and connecting the pressure inlet .
